

ACCOUNTS

ACCOUNT DRIVERS - CLOSE PRODUCTION WORK ORDER - STOCK

An accounts driver is an event that will check the transaction you are busy with on Nucleus Service and verify whether there is a financial effect to be posted to Nucleus Accounts or Sage Evolution. Refer to the <u>Account Driver</u> <u>Introduction</u> manual for more information.

The example below is based on the Non-Segmented 'Base' General Ledger.

CLOSE PRODUCTION WORK ORDER - STOCK (CPWP)

When a work order is closed, after a Production Run, all costs for stock items on the work order will be processed to Manufacturing Stock Variance from Manufacturing Work in Progress. This amount will be cleared by <u>PAJI</u> / <u>PADI</u> (Finished Goods drivers). If the Product is configured to use the unit cost of the underlying items, the entire amount will be cleared. If the Product is configured to 'Use Std Price', the variance between the cost and standard price will remain in the Manufacturing Variance and will need to journalled to the relevant general ledger account.
