GETTING STARTED

INVENTORY

Inventory in Nucleus Service is divided into 3 classes;

A-Class Items:

- These items would be the main unit e.g. a copier machine.
- These are serialised single-line items

B-Class Items:

- These are serialised single-line items.
- These are like C-Class items, in that a B-Class stock item can be issued out and not billed.
- These items would not be a main unit / machine but would be an accessory e.g. a drum for a copier machine.

C-Class Items:

- These are (non-serialised) stock items.
- These are stored in the system with a weighted average unit cost per warehouse and bin.
- These items can be managed in batches if batch tracking is enabled.

A /B /C-Class items can further be classified as **stock** or **assets**.

Stock:

- Stock is a store of A / B / C class items, ready for sale or servicing purposes.

Assets:

- Assets are A / B-Class (serialised) non-stock items (e.g. a copier machine), which could require a maintenance schedule and trace-ability records.
- These items are stored as 'single-line' items. Each item will have it's own serial number, unit cost and history.
